1   Status Update

For this final project, I decided to focus on XML Applications with DOM and
SAX. So far, I was able to use the program DOMEcho.java given by Professor
Kapfhammer in a version control repository. By studying the source code in a
file of DOMEcho.java, I was able to modify the source code to be able to delete
the command line arguments that were not necessary to use for the purposes I
set out to have when completing this final project. I was also able to implement
SAXecho.java program to be able to parse any XML file using Simple API XML.
I was able to successfully implement this two programs and now I was able to
find different XML files of different sizes to be tested to see which of the two
programs that I have modified and implemented has better performance. I was
successful in finding an XML file that was over 200mb that I will be testing to
see which of the two programs has the better performance.
